| Case Height | 63mm |
| Case Depth | 26mm |
| Lever Projection From Case | 15mm |
| Cylinder Diameter | 32mm |
| Cylinder Ring Outside Diameter | 45mm |

Important Info Before You Buy

- For use on inward opening doors only
- Roller bolt night latches are used in place of a standard "Yale" style night latch, in multi-place occupancies i.e. flats with communal front door.
- Conforms to current fire regulations concerning means of escape in event of fire
- When you pull the lever down (clockwise) on the lock case the roller bolt extends in to the keep on the frame to keep the door closed.
- When the lever is in the Horizontal position (shown in the image) the roller bolt is withdrawn and the night latch is in open position
- Roller bolt is withdrawn from outside and by quarter turn of key in one direction and engaged by turning the key a quarter turn the other direction
- This means the door can only be locked by someone physically turning the key or handle hence you can't get locked out just by the door closing
- Suitable for doors up to 54mm thickness
- Comes with cylinder, cylinder ring and two keys
